

## AUTOMATIC SELF-TREATING INSECTICIDE APPLICATORS

Only the WIK<sup>®</sup> – the oldest and most respected name in livestock insect control – provides applicators and insecticide tailored to the needs of all livestock types and herd sizes.

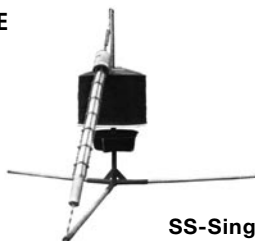

### THE SUPREME

Enjoy additional coverage and excellent protection for your livestock with the Supreme Wik<sup>®</sup> System.

- For use in pasture, paddock, or lot
- Portable—easily moved around with wheel kit, loader, or bale bed kit
- One, two, or three applicators handle up to 150 head (105 cow/ calf pairs)
- Durable construction and unique spring design handle hard use for years
- Applicators hang at a 45° angle with six feet of scratching surface to handle a range of cattle sizes—from small calf to large dairy animal
- No moving parts to break, freeze or malfunction
- Large reservoirs require filling only once a month
- No stressing or handling of cattle, they self-treat
- Saves labor—no gathering, running through chutes, measuring, pouring, or tagging
- Case-hardened chain and grooming rings offer five-year guarantee
- Add mineral feeder and face fly fighter hood
- Excellent protection from face fly
- Hood and curtain keep mineral and salt dry
- Heavy canvas curtain won't blow in high winds
- Solves pink eye problem
- Hood reservoir holds 30 to 40 day supply of insecticide
- Neoprene tub lasts longer than plastic or metal
- Short stand available for cow/calf operation

### THE CLASSIC

Rugged and versatile, the Classic Wik<sup>®</sup> System provides continuous year-round treatment for your livestock and meets all your insecticide applicator needs for dairy or beef cattle. For less intensive needs, the WIK can be adapted to fit your special conditions.

## THE WIK® METHOD PLUS SCRATCHING RINGS IN TWO STRENGTHS

### WIK INSECTICIDE TANK

One applicator insecticide tank is used to supply each roll. Insecticide is wick fed from the tank through a tube into the top of the roll. There are no valves, pumps or orifices to clog. The wick feeds from the bottom of the tank so that insecticide is fed until the tank is empty.

### AGGRESSIVE RING

Applicator rings for steers or bulls have squared edged scratching lugs that allow the beef breeds to get the vigorous scratching they need for relief. As they rub on the rings and chains, insecticide is applied by the fabric roll. The rubbing also curries and conditions their coat. The improved appearance of WIK groomed cattle helps bring a higher price.

### STANDARD RING

The applicator ring for lactating beef and dairy cattle is designed to give a gentler scratching action than the aggressive ring. The rounded and smoother contour of these rings provides gentler scratching action for dairy cattle. Milk producing efficiency is increased when the cow can get relief from insects when needed, not just at milking time.

Call us today to learn how  
The WIK® self-treatment system  
helps beef and dairy producers  
control pests and increase profits.
